

# Package ‘GEVStableGarch’

July 26, 2015

**Type** Package

[stable and GEV](#)

**Title** ARMA-GARCH/APARCH models with GEV and stable distributions

**Version** 1.1

**Date** 2015-07-19

**Author** Thiago do Rego Sousa, Cira Etheowalda Guevara Otiniano and Silvia Regina Costa Lopes

**Maintainer** Thiago do Rego Sousa <thiagoeconomico@gmail.com>

[Package for estimation of ...](#)

**Description** Package for ARMA-GARCH or ARMA-  
APARCH modelling with GEV and stable conditional distributions.

**License** GPL (>=2)

**Depends** R(>= 2.15.0),fGarch,fExtremes,stabledist,skewt,Rsolnp

**Additional\_repositories** <http://www.robustanalysis.com>

GEVStableGarch-package

*ARMA-GARCH/APARCH modelling with **GEV and stable distributions***

---

## Description

This package is design to perform maximum likelihood estimation of ARMA-GARCH/APARCH models with **Generalized Extreme Distribution (GEV) or stable conditional distributions**.

## Details

Package: GEVStableGarch  
 Type: Package  
 Version: 1.1  
 Date: 2015-07-19  
 License: GPL(>=2)  
 Depends: R(>= 2.15.0), fGarch, fExtremes, stabledist, skewt, Rsolnp  
 with heavy tailed distributions, such as GEV, stable and generalized  
 asymmetric t (GAt). Other common conditional distributions such as the  
 normal, skew Student's t and generalized error distribution (GED) are also  
 allowed.

This package contains functions for estimating and simulating combined ARMA-GARCH or ARMA-APARCH models with error distributions following GEV or stable densities. The current version has a new algorithm that allows the user to enforce stationarity during estimation. The package also allows the user to estimate several models and choose the best one according to a goodness-of-fit Criteria.

fGEVSTABLEGARCH-class    Class "fGEVSTABLEGARCH"

---

## Description

The class fGEVSTABLEGARCH represents an ARMA-GARCH/APARCH model estimated with function gsFit

## Objects from the Class

by calling function

Objects can be created by ~~calls of the form~~ gsFit. This object contains the estimated parameters of a time series process.

## Slots

call: Object of class "call": the call of the gsFit function.

formula: Object of class "formula": a formula object specifying mean and variance equation

method: Object of class "character": a string denoting the optimization method.   
~~value: A value different from zero indicates a failure in achieving convergence.~~

convergence: Object of class "numeric": an integer code. 0 indicates successful convergence ~~of the of the estimation routine.~~ This variable is the same returned by the one of the optimization methods, which could be one of solnp or nlminb routines. Notice that sometimes the optimization algorithm will return a "true" convergence, even when the optimized negative log-likelihood equals to 1e99. In this case, ~~the variable convergence will be equal to 1~~ to indicate that convergence was not achieved.   
~~we set the variable \code{convergence} to 1~~

messages: Object of class "list": a character string giving ~~any~~ additional information collected during the estimation ~~of the model.~~   
**informations**

data: Object of class "numeric": a numeric vector containing the data of the time series to be estimated.

fit: Object of class "list": a list with the results from the parameter estimation.

residuals: Object of class "numeric": a numeric vector with the residual values.

h.t: Object of class "numeric": a numeric vector with the conditional variances.

sigma.t: Object of class "numeric": a numeric vector with the conditional standard deviations.

title: Object of class "character": a string with the title.

description: Object of class "character": a string with a description.

## Methods

**show** signature(object = "fGEVSTABLEGARCH"): prints an object of class 'fGEVSTABLEGARCH'.

## Author(s)

Thiago do Rego Sousa, Cira Etheowalda Guevara Otiniano and Silvia Regina Costa Lopes.

---

fGEVSTABLEGARCHSPEC-class

Class "fGEVSTABLEGARCHSPEC"

---

## Description

This class represents an ARMA-GARCH/APARCH model with innovations following an i.i.d stable, GEV distributions. Other distributions are also allowed.

## Objects from the Class

Objects can be created by calls of the function `gsSpec`. This object specifies an univariate ARMA-GARCH/APARCH model with GEV or stable conditional distribution. Note that we only allow the user to create an object that do not violate the model specifications. For more details about the definition of those models see: see Mittnik et al. (2002) (stable innovations), Zhao et al. (2011) (GEV innovations) and Wuertz et al. (2008) (finite variance innovations).

[citar Paoletta](#)

## Slots

`call`: Object of class "call": the call of the `gsSpec` function.

`formula`: Object of class "formula": a list with two formula entries for the mean and variance equation of the combined ARMA-GARCH/APARCH model.

`model`: Object of class "list": a list with the model parameters specifying the Autoregressive, the GARCH/APARCH and the innovations parameters.

`presample`: Object of class "matrix": a numeric matrix with presample values.

`distribution`: Object of class "character": a character string with the name of the conditional distribution.

`rseed`: Object of class "numeric": an integer with the random number generator seed.

## Methods

`show` `signature(object = "fGEVSTABLEGARCHSPEC")`: prints an object of class 'fGEVSTABLEGARCH'

## Author(s)

Thiago do Rego Sousa, Cira Etheowalda Guevara Otiniano and Silvia Regina Costa Lopes.

GAt

*Generalized Asymmetric t Distribution***Description**

Functions to compute density, distribution function, quantile function and to generate random variates for the generalized asymmetric t distribution (GAt). Notice that this is the same t3-distribution mentioned in the literature defined by Paoletta (1997). The GAt distribution includes the Student's t, Laplace, Cauchy and the normal distribution when the shape parameter (nu) goes to infinity (see see Mittnik and Paoletta (2000)).

**Usage**

```
dGAt(x, mean = 0, sd = 1, nu = 2, d = 3, xi = 1, log = FALSE)
pGAt(q, mean = 0, sd = 1, nu = 2, d = 3, xi = 1)
qGAt(p, mean = 0, sd = 1, nu = 2, d = 3, xi = 1)
rGAt(n, mean = 0, sd = 1, nu = 2, d = 3, xi = 1)
```

**Arguments**

mean, sd, d, nu, xi	location parameter mean, scale parameter sd, shape 1 parameter nu, shape 2 parameter d, asymmetry parameter xi.
n	the number of observations.
p	a numeric vector of probabilities.
x, q	a numeric vector of quantiles.
log	a logical; if TRUE, densities are given as log densities.

**Value**

d\* returns the density, p\* returns the distribution function, q\* returns the quantile function, and r\* generates random deviates,  
all values are numeric vectors.

**Author(s)**

Thiago do Rego Sousa, Cira Etheowalda Guevara Otiniano and Silvia Regina Costa Lopes.

**References**

**Examples**

**Comentario do tipo: adapted  
from fGarch example...**

```
# Simulate Random Values and compare with
# the empirical density and probability functions

# Configure plot and generate random values
par(mfrow = c(2, 2))
set.seed(1000)
r = rGAt(n = 1000)
plot(r, type = "l", main = "GAt Random Values", col = "steelblue")

# Plot empirical density and compare with true density:
hist(r, n = 25, probability = TRUE, border = "white", col = "steelblue")
box()
x = seq(min(r), max(r), length = 201)
lines(x, dGAt(x), lwd = 2)

# Plot density function and compare with true df:
plot(sort(r), (1:1000/1000), main = "Probability", col = "steelblue",
      ylab = "Probability")
lines(x, pGAt(x), lwd = 2)

# Compute quantiles:
# Here we compute the quantiles corresponding to the probability points from
# -10 to 10 and expect to obtain the same input sequence
round(qGAt(pGAt(q = seq(-10, 10, by = 0.5))), digits = 6)
```

---

 gsFit

*Estimation of ARMA-GARCH/APARCH models*

---

**Description**

This function uses Maximum Likelihood technique to estimate the parameters of ARMA-GARCH or ARMA-APARCH model with several conditional distributions. The user can also enforce stationarity during estimation

**Usage**

```
gsFit(formula = ~garch(1, 1), data, cond.dist = c("stableS0", "stableS1",
"stableS2", "gev", "GAt", "norm", "std", "sstd", "skstd", "ged"),
include.mean = TRUE, algorithm = c("sqp", "sqp.restriction",
"nlminb", "nlminb+nm"), control = NULL,
tolerance = NULL, title = NULL, description = NULL)
```

**The mean equation should  
be specified using the  
names: 'arma', 'garch' or  
'aparch' names. For  
example: ~arma(1,0)-  
garch(1,0) for AR(1)-  
ARCH(1), and ~arma(0,1)-  
garch(2,2) for MA(1)-  
GARCH(2,2).**

**Arguments**

formula	a formula object specifying mean and variance equation.
data	a numeric vector containing the data of the time series to be estimated.

		colocar nome da distribuiçao entre parentese
cond.dist	a character string naming conditional distribution of innovations. The package was created to accept the following distributions: "stableS0", "stableS1", "stableS2", "gev" and "GAt". Other common distributions are also possible such as the "norm", "std", "sstd", "skstd", "ged", but they are not the main feature of this work.	
include.mean	This is a boolean variable. If intercept is TRUE then we estimate the model with intercept, otherwise we will not use the intercept variable.	
algorithm	The algorithm to be used to optimize the likelihood of the process. This parameter should be one of the following strings: "nlminb" (nlminb R internal Routine for optimization) or "SQP" (Sequential quadratic programming routine implemented in package RSolnp).	search for the optimum value code
sqp primeiro		
control	Control parameters used either in "SQP" routine (see the RSolnp documentation) or in "nlminb" (see the nlminb R documentation).	
tolerance	Tolerance for parameter estimation.	When specified, the tolerance parameter should be passed as a list (TOLG = 1e-8, TOLSTABLE = 1e-2, TOLSTATIONARITY = 1e-3), where
title	a string with the title.	used to set the boundary of the general model, TOLSTABLE is the boundary
description	a string with a description.	stable distribution and TOLSTATIONARITY is the tolerance parameter used in the algorithm when searching for the stationary solution

## Details

The starting values are key in getting any possible convergence value and they were chosen to reflect this. For example, the GEV shape starting value was chosen to be 0.01 since in many cases we can not obtain good results. There is also the possibility to fit models with conditional "Normal", "t-student" and "skew t-student" distributions but the main purpose of this routine is to deal with "GEV" and "stable". The parameters will be interpreted according to the following equations (see Wurtz et al. ,2006)

$$X_t = \mu + \sum_{i=1}^m a_i X_{t-i} + \sum_{j=1}^n b_j \varepsilon_{t-j} + \varepsilon_t$$

$$\varepsilon_t = \sigma_t z_t, \quad z_t \stackrel{iid}{\sim} D(0, 1),$$

$$\sigma_t^\delta = \omega + \sum_{i=1}^p \alpha_i (\varepsilon_{t-i} - \gamma_i |\varepsilon_{t-i}|)^\delta + \sum_{j=1}^q \beta_j \sigma_{t-j}^\delta$$

where

$$\underline{X_t}$$

is the ARMA process,

$$\sigma_t^\delta$$

is the APARCH process and

$$D(v)$$

$$D(0, 1)$$

is the standard density distribution to be used in the model.

The distribution  $D(0, 1)$  is the density of the innovations with zero location and unit scale and  $\gamma$  are additional distributional parameters that describe the skew and the shape of the distribution.

## Value

gsFit

espaco

returns a S4 object of class "fGEVSTABLEGARCH" with the following slots:

@call the call of the gsFit function.

@formula a list with two formula entries, one for the mean and the other one for the variance equation. Note that only ARMA, GARCH or APARCH models.

@method	a string denoting the optimization method.
@data	a numeric vector containing the data of <del>the time series to be estimated.</del> <b>estimated time series</b>
@fit	a list with the results from the parameter estimation.
@residuals	a numeric vector with the residual values <b>epsilon t</b>
@h.t	a numeric vector with the residual values ( $h_t = \sigma_t^\delta$ ).
@sigma.t	a numeric vector with the conditional standard deviation. <b>sigma t</b>
@title	a string with the title.
@description	a string with a description.

The entries of the @fit slot show the results from the optimization.  
[details of the @fit slot](#)

### Enhances

Reescrever essa parte

The estimation of ARMA-GARCH/APARCH models with conditional stable distribution is mainly dependent on the time taken during the calculation of density points. Our routine uses the standard R stable density implemented in package **stabledist**. There is also another numerical routine to calculate stable densities which is part of an R package called **stable**. This package implements a faster computation of stable densities that are accurately enough to perform numerical optimization. When **GEVStableGarch** loads it verifies if package **stable** is available. If it is found the function **GSGarch.Fit** will perform optimization using **stable**'s routine. Otherwise it will use stable density from package **stabledist**. Package **stable** is available at <http://www.robustanalysis.com>.

gsSim

*Simulation of ARMA-GARCH/APARCH process*

## Description

This functions simulate time series following ARMA-GARCH/APARCH models with ~~several conditional distributions, including GEV and stable distributions.~~  
[with stable and GEV distributions.](#)

## Usage

```
gsSim(spec = garchSpec(), n = 100, n.start = 100)
```

## Arguments

spec	A model specified with function gsSpec
n	The size of simulated time serie
n.start	

## Details

The initial values of the time series are fixed and the recursion formulas of the model are used to simulate the dynamics of the process. We do not verify the stationarity conditions of the model because the simulation of non-stationary process could also be of interest.

[by the researcher](#)

## Value

The function returns an object containing the following items:

model	A string describing the estimated model.
cond.dist	The conditional distribution used to fit the model.
series	An array of two columns. The first column is the simulated process

[Explicar direito, aqui tah errado](#)

 $X_t$ 

and the second one is the

 $\sigma_t$ 

simulated process.

**Examples**

```
# Simulation of a ARMA-APARCH process with stable conditional distribution
#x <- GSgarch.Sim(N = 2500, mu = 0.1,a = c(0.2,0.3),b = c(0.2,0.5),
#omega = 0.1, alpha = c(0.1,0.2),beta = c(0.1,0.1),gm=c(0.3,-0.3),
#delta = 1,skew = 0.3,shape = 1.9, cond.dis = "stable")
```

---

gsSpec	<i>Specification of ARMA-GARCH/APARCH models with GEV or stable distributions</i>
--------	---

---

**Description**

Specifies an ARMA-GARCH or ARMA-APARCH model with innovations following GEV, stable ~~or other common conditional~~ distributions.

**Usage**

```
gsSpec(model = list(), presample = NULL,
cond.dist = c("stableS0", "stableS1", "stableS2", "gev",
"GAT", "norm", "std", "sstd", "skstd", "ged"),
rseed = NULL)
```

**Arguments**

- model** a list of ARMA-GARCH/APARCH model parameters:  
omega - the coefficient of the variance equation, ~~by default 1e-6~~;  
alpha - the value or vector of autoregressive coefficients;  
beta - the value or vector of variance coefficients;  
The values for the ARMA part are:  
mu - the mean value;  
ar - the autoregressive coefficients;  
ma - the moving average coefficients.  
The parameters for the conditional distributions are:  
skew - the skewness parameter;  
shape - the shape parameter.
- presample** presample - a numeric "matrix" with 3 columns and ~~at least~~ max(m,n,p,q) rows. The first column are the innovations, the second the conditional variances, and the last the time series. When presample is missing, we construct our presample matrix as [z,h,y] where z = rnorm(0,1), h = "uev" recursion initialization

[code](#)

	described in Wuertz et al. (2006) and $y = \mu$ . Note that the conditional variance column can contain only strictly positive numbers and the function gsSpec check for invalid values <del>inside the presample matrix.</del> <a href="#">checks</a>
cond.dist <a href="#">Copiar la de cima</a>	a character string naming conditional distribution of innovations. The package was created to accept the following distributions: "stableS0", "stableS1", "stableS2", "gev" and "GAt". Other common distributions are also possible such as the "norm", "std", "sstd", "skstd", "ged", but they are not the main feature of this work.
rseed	the seed for the initialization of the random number generator for the innovations.

Details

This functions uses the interface of the garchSpec routine from package **fGarch** to simulate random values of the ARMA-GARCH/APARCH model with conditional GEV or stable distribution.

Value

The returned value is an object of class "fGEVSTABLEGARCHSPEC".

---

Description

Methods to organize the output to the user when printing objects of class GEVSTABLEGARCH

## Methods

signature(object = "fGEVSTABLEGARCH") Print function for objects of class "fGEVSTABLEGARCH"

signature(object = "fGEVSTABLEGARCHSPEC") Print function for objects of class "fGEVSTABLEGARCHSPEC"

## Author(s)

skstd

*Skew Student's t Distribtuion from Fernandez and Steel (1997)*

---

## Description

Functions to compute density, distribution function, quantile function and to generate random ~~vari-~~<sup>values</sup> ~~ates~~ for the Skew Student's t **Distribtuion** from Fernandez and Steel (1997). Notice that this function is different from the skew Student's t `sstd` from package `fGarch`. Although the two distributions use the same approach from Fernandez and Steel (1997), the second one was reparameterized in such a way that when the parameters `mean = 0` and `sd = 1` the distribution will have a true mean equal zero and the true variance equals to one, no matter the value of the skew parameter. The distributions `skstd` and `sstd` are the same when the asymmetry parameter `xi` equals to 1, in which case they are symmetric. **they correspond to the symmetric Student's t distribution.**

## Usage

```
dskstd(x, mean = 0, sd = 1, nu = 3, xi = 1, log = FALSE)
pskstd(q, mean = 0, sd = 1, nu = 3, xi = 1)
qskstd(p, mean = 0, sd = 1, nu = 3, xi = 1)
rskstd(n, mean = 0, sd = 1, nu = 3, xi = 1)
```

## Arguments

<code>mean, sd, nu, xi</code>	location parameter <code>mean</code> , scale parameter <code>sd</code> , shape parameter <code>nu</code> , asymmetry parameter <code>xi</code> .
<code>n</code>	the number of observations.
<code>p</code>	a numeric vector of probabilities.
<code>x, q</code>	a numeric vector of quantiles.
<code>log</code>	a logical; if <code>TRUE</code> , densities are given as log densities.

## Value

`d*` returns the density, `p*` returns the distribution function, `q*` returns the quantile function, and `r*` generates random deviates,  
<sup>espaco</sup> all values are numeric vectors.

## Author(s)

## Examples

```
# Simulate Random Values and compare with
# the empirical density and probability functions

# Configure plot and generate random values
par(mfrow = c(2, 2))
set.seed(1000)
r = rskstd(n = 1000)
plot(r, type = "l", main = "Skew Student's t Random Values", col = "steelblue")

# Plot empirical density and compare with true density:
hist(r, n = 25, probability = TRUE, border = "white", col = "steelblue")
box()
x = seq(min(r), max(r), length = 201)
lines(x, dskstd(x), lwd = 2)

# Plot density function and compare with true df:
plot(sort(r), (1:1000/1000), main = "Probability", col = "steelblue",
      ylab = "Probability")
lines(x, pskstd(x), lwd = 2)

# Compute quantiles:
# Here we compute the quantiles corresponding to the probability points from
# -10 to 10 and expect to obtain the same input sequence
round(qskstd(pskstd(q = seq(-10, 10, by = 0.5))), digits = 6)
```
